The increase in demand for electricity and the growing energy density in metropolitan cities have made it necessary to extend the existing high voltage network right up to the consumer. Stepping down the voltage from transmission to the distribution level at the substations located near the actual consumers not only yields economic advantages, but also ensures reliable power supply. Such substations are required to meet a number of severe requirements, including small installation size, effective protection against atmospheric pollution and moisture, noiseless operation, nonexplosive and flame resistant, reduced maintenance, minimal radio interference while providing excellent electric characteristics. Conventional substations using atmospheric air as the main dielectric cannot satisfy these requirements, but totally enclosed substations using sulphur hexafluoride (SF<sub>6</sub>) gas insulation that are also known as Gas Insulated Substations (GIS). GIS is now in widespread use in the electrical power industry, especially in metropolitan areas. The fundamental, applied and industrial research described in the book allows the electric power industry to transmit and distribute electrical energy in more efficient, safe and environmentally acceptable ways.

The book is written for students as well as for teachers and researchers in the field of High Voltage and Insulation Engineering. It is based on the advance level courses conducted at TU Dresden, Germany and Indian Institute of Technology Kanpur, India. The book has a novel approach describing the fundamental concept of field dependent behavior of dielectrics subjected to high voltage. There is no other book in the field of high voltage engineering following this new approach in describing the behavior of dielectrics. The contents begin with the description of fundamental terminology in the subject of high voltage engineering. It is followed by the classification of electric fields and the techniques of field estimation. Performance of gaseous, liquid and solid dielectrics under different field conditions is described in the subsequent chapters. Separate chapters on vacuum as insulation and the lightning phenomenon are included.

The insulating medium used in gas-insulated switchgear is SF<sub>6</sub> gas, which has been widely used in substations. Energy generated by discharge will cause the composition of SF<sub>6</sub> and generate characteristic component gases. Diagnosing the insulation defect through analyzing the decomposed gases of SF<sub>6</sub> by chemical gas sensors is the optimal method due to its advantages. Carbon nanotubes, TiO<sub>2</sub> nanotubes and graphene are chosen as the gas-sensing materials to build specific gas sensors for detecting each kind of SF<sub>6</sub> decomposed gases and then enhance the gas sensitivity and selectivity by material modification. The properties and preparation methods are introduced in this book. The author studied the micro-adsorption mechanism and macro-gas sensing properties by theoretical calculation and sensing experiment.

This book addresses the very latest research and development issues in high voltage technology and is intended as a reference source for researchers and students in the field, specifically covering developments throughout the past decade. This unique blend of expert authors and comprehensive subject coverage means that this book is ideally suited as a reference source for engineers and academics in the field for years to come.

In a Gas insulated substations, the operation of disconnecter switches and circuit breakers can cause Very Fast Transient Over voltages (VFTOs), which will bring an instantaneous change in voltage with a very short rise time and it is normally followed by oscillation having high frequencies. For designing the insulation level of a substation, it is essential to know the maximum value of VFTO. Fast operating disconnecter switches are usually used to reduce time of the breakdown; however, it cannot eliminate fully the effect of the VFTO. This Book results the most accurate results of Very Fast Transient over Voltages of 132 KV transformer caused by the switching operation. A 132KV transformer is designed using EMTP-RV simulin, the VFTOs generated by the switching operations have been analyzed and are presented. The VFTOs generated due to Disconnecter switching operation can cause insulation failure at very high voltage levels. The reasons of these problems are travelling waves which is generated during switching operations in a gas-insulated substation (GIS). Calculation of Very Fast Transient Overvoltage has been carried out using EMTP-RV for various switching.

Around 80% of electrical consumption in an industrialised society is used by machinery and electrical drives. Therefore, it is key to have reliable grids that feed these electrical assets. Consequently, it is necessary to carry out pre-commissioning tests of their insulation systems and, in some cases, to implement an online condition monitoring and trending analysis of key variables, such as partial discharges and temperature, among others. Because the tests carried out for analysing the dielectric behaviour of insulation systems are commonly standardised, it is of interest to have tools that simulate the real behaviour of those and their weaknesses to prevent electrical breakdowns. The aim of this book is to provide the reader with models for electrical insulation

systems diagnosis.

Ever increasing demand for electric power necessitates large generation capacity addition and commensurate increase in transmission and distribution network. It is projected that developing countries need transmission lines which carry more than 5000 MW over comparatively longer distances. It is understood that by increasing the transmission line voltage, power transmission of the desired order could be achieved. High voltage transmission system by AC/DC necessitates the considerations of number of factors in the design of line and substation equipment with regard to right of way, insulation, overvoltage, electromagnetic field effects, etc. Further, it is also essential to consider proper testing, condition monitoring & fault diagnosis etc of such large power equipment to ensure safe and reliable operation of the power system. This conference will provide a common platform for all researchers to share their ideas on the latest development in HV transmission system.
