The legacy of Geoff Maitland and his seminal work, Vertebral Manipulation, continues in this eighth edition, with Elly Hengeveld and Kevin Banks leading an international team of experts who demonstrate how to manage vertebral neuromusculoskeletal disorders using the principles and practice of the Maitland Concept. Together, they ensure the heart of the Concept beats on by promoting collaborative decision-making with the patient at centre and emphasizing the art and science of observation, listening, palpation and movement skills. A key feature of the new edition focuses on a more evidence-based and analytical view of the role of mobilization and manipulation in clinical practice The authors have written in a way that reflects their application of the Maitland Concept and how they have integrated techniques in the light of advancement in professional knowledge. Each chapter stands alone as a 'master class'. The text is systematically arranged focusing on detailed assessment, clinical reasoning and re-assessment to determine the physical dysfunction and efficacy of manipulative physiotherapy techniques, while also advocating continuous communication and interaction. Techniques of passive mobilization are also described, specifically designed around the individual patient's condition. All the chapters are written from a clinical perspective and review the evidence which informs how to deal with and manage spinal and pelvic pain as they present to the practitioner. Furthermore, each vertebral region (cervical, thoracic, lumbar, sacroiliac/pelvic) is considered from the point of view of best practice in analysing and hypothesising subjective data, examination, treatment and management of spinal pain conditions. Brand new to the eighth edition is the addition of a companion website – Maitland's Manipulation eResources (www.maitlandsresources.com) – providing access to a range of valuable learning materials which include videos, MCQs, interactive case studies, research links, and bonus chapters World-leading experts provide evidence relating the Maitland Concept to clinical practice Evidence supporting practice Covers both subjective and physical examination Best practice management

The control of balance by the central nervous system is crucial to maintain our posture and perform efficiently our daily motor tasks. This control requires the development of dynamical phenomena subserved by highly-coordinated patterns of muscle activation/deactivation disseminated throughout the whole-body and called “postural adjustments”. Establishing the interaction between balance control, locomotion and cognition has important clinical implication, especially in term of falls prevention, and will improve our knowledge on the underlying neural correlates. This Research Topic provides an up-to-date picture of the relationship between postural adjustments, body balance and motor performance in healthy (young and older adults) and pathological participants. It includes 36 contributions (1 editorial, 28 original articles, 4 reviews and 3 methods articles) which are separated into four sections: 1. Postural maintenance and multisensory integration, 2. Anticipatory postural adjustments associated with voluntary movement, 3. Postural adjustments associated with predictable and unpredictable external perturbation, 4. Gait assessment and rehabilitation in aging. Beside their basic interest of unveiling the mechanisms behind motor control, results from the investigations of this topic are relevant to develop new methods or tools to improve postural stability and motor performance, with applications in the fields of neurodegenerative conditions, rehabilitation, ergonomics and sports sciences.

This book is the updated English version (not a mere translation) of a textbook which appeared successively in Czech, in German, in Bulgarian, in Dutch and in Polish. This English version is shorter, more concise and includes the latest techniques. The role of manipulation is limited to passive mobility and an important part of this book deals with active mobility. The author emphasizes that this is a textbook and not a manual of techniques: the latter deals with individual techniques, while his purpose is to show that it can be disastrous to confine one's interest in this manner and to remain unaware of both the broader context of treatment and of the possible alternatives. There are chapters on functional anatomy, the diagnosis and treatment of disturbed locomotor system function, including indications of appropriate treatment and the place of manipulation, and finally a long chapter on the clinical aspects of impaired function of the locomotor system. The book begins by discussing the major role played by impaired function in the vast majority of patients suffering from pain arising in the locomotor system. This type of pain is altogether the most frequent from which patients suffer, and the first two chapters of this book are mainly concerned with the origin of this pain. It is traditionally associated with rheumatism, but unfortunately rheumatologists are insufficiently aware of locomotor function and leave this field largely to neurologists and orthopaedic surgeons. The author believes that the speciality which is principally concerned with impaired function and its restoration to normal is rehabilitation medicine, a term which includes physical therapy, and it is in this framework that the future of manipulation lies. This will continue to be the case until, one day, a new speciality is established, one which deals with the whole of the locomotor system and in particular with its function. Ideally, it should be called "Musculo-skeletal Medicine".

This book considers mainly diagnosis, screening, surveillance and treatment of abdominal, thoracoabdominal and thoracic aortic aneurysms. It addresses vascular and cardiothoracic surgeons and interventional radiologists, but also anyone engaged in vascular medicine. The high mortality of ruptured aneurysms certainly favors the recommendation of prophylactic repair of asymptomatic aortic aneurysms (AA) and therewith a generous screening. However, the comorbidities of these patients and their age have to be kept in mind if the efficacy and cost effectiveness of screening and prophylactic surgery should not be overestimated. The treatment recommendations which will be outlined here, have to regard on the one hand the natural course of the disease, the risk of rupture, and the life expectancy of the patient, and on the other hand the morbidity and mortality of the prophylactic surgical intervention. The book describes perioperative mortality after endovascular and open repair of AA, long-term outcome after repair, and the cost-effectiveness of treatment.

This book completes Jean-Pierre Barral's widely acclaimed four-volume exploration of the osteopathic implications of the dysfunctions of the internal viscera. The focus of this volume is on the pelvis, especially of women. The introduction provides an overview of the relationships of the pelvis and spine. Tests which are particularly useful for pelvic disorders, including the genitohumeral and completed Laségue's tests, are detailed. Also included are imaging studies that demonstrate the utility of the viscerals manipulative approach to the pelvis. Chapter 2 focuses on the bladder, and especially the treatment of stress incontinence and the effects of the various systems of pressure on the lower pelvis. The role of bladder restrictions in low back pain, lower leg problems, and hip pain is explained. Chapter 3 discusses the uterus, focusing on the cervix. The reader will gain an appreciation for the osteopathic view of the importance of the different motions affecting the uterus, and how they can become dysfunctional. Chapter 4 concludes the tour of the female pelvis with the uterine tubes and ovaries. The holistic osteopathic viewpoint is typified by Barral's presentation of the various elements that must work in harmony for fertilization to occur.
